

## **Is Airlines the safest means of Transportation – Infographic**

Donut chart shows the airline fatalities in US airlines versus rest of the world. The fatalities by US airlines is 25% of all the world fatalities.

Bar chart shows comparison of Fatalities between 1985-1999 and 2000-2014. The number of fatalities has decreased over the years. Airlines have taken measure based on previous incidents which shows in decrease in incidents.

Airlines are safer compared to roads – The number of reported crashes by road is close to 35,000 whereas the number of reported fatal crashes is 115 in 2018. This shows the airlines are safe when compared to roads.

Airlines are reliable – Visualization shows that 94% of total flights have arrived on time. This is an important factor. The number of people commuting in roads are more and the time taken to reach the destination could be more based on weather and traffic. Airlines are definitely the fastest means of transportation.

Total departed flights have consistently increased over the years. This shows the more and more people are using airlines.

39% drop in Airfare – The airline price has decreased over the years. Although the number of passengers departed has increased, the average airfare price has decreased and it is affordable by many people.

All the above data point to one important thing – Airlines are safest means of Transportation. With more people using this service to reach destination on time with affordable price, it is safe, fast and affordable.
